We have a procedure for dynamic analysis of *MDOF* systems based on modal superposition that is both simple and efficient, simple because the modal response can be easily computed with the most advantageous technique that is available for *SDOF* systems, efficient because usually (we will return on this) only the modal responses of a few lower modes are required to accurately describe the structural response.

As the structural matrices are easily assembled using the *FEM*, our modal superposition procedure is ready to be applied to structures with tenth, thousands or millions of *DOF*'s! except that we can compute the eigenpairs only when the analyzed structure has two, three or maybe four degrees of freedom...

Enter the various Matrix Iterations procedures

Second Mode Analysis Higher Modes

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

First, we will see an iterative procedure whose outputs are the first, or fundamental, mode shape vector and the corresponding eigenvalue.

When an undamped system freely vibrates, the equation of motion is

$$K\psi_{\mathfrak{i}}=\omega_{\mathfrak{i}}^{2}M\psi_{\mathfrak{i}}.$$

In equilibrium terms, the elastic forces are equal to the inertial forces when the systems oscillates with frequency  $\omega_i^2$  and mode shape  $\psi_i$ 

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

Our iterative procedure will be based on finding a new displacement vector  $\mathbf{x}_{n+1}$  such that the elastic forces  $\mathbf{f}_S = \mathbf{K} \mathbf{x}_{i+1}$  are in equilibrium with the inertial forces due to the old displacement vector  $\mathbf{x}_n$ ,  $\mathbf{f}_I = \omega_i^2 M \mathbf{x}_n$ . In equations,

$$Kx_{n+1} = \omega_i^2 Mx_n$$
.

Premultiplying by the inverse of K and introducing the Dynamic Matrix,  $D=K^{-1}M$ 

$$x_{n+1} = \omega_i^2 \mathbf{K}^{-1} \mathbf{M} \, x_n = \omega_i^2 \mathbf{D} \, x_n.$$

It is evident that in the generative equation above we miss a fundamental part, the square of the free vibration frequency  $\omega_i^2$ .

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

This problem is solved considering the  $x_n$  as a sequence of *normalized* vectors and introducing the idea of an *unnormalized* new displacement vector,  $\hat{x}_{n+1}$ .

$$\hat{\mathbf{x}}_{n+1} = \mathbf{D} \mathbf{x}_n$$
,

note that we removed the explicit dependency on  $\omega_{\mathfrak{i}}^2.$ 

The normalized vector is obtained applying to  $\hat{x}_{n+1}$  a normalizing factor,  $\mathfrak{F}_{n+1}$ ,

$$x_{n+1} = \frac{\hat{x}_{n+1}}{\mathfrak{F}_{n+1}},$$

$$\text{but} \qquad x_{n+1} = \omega_i^2 D \, x_n = \omega_i^2 \, \hat{x}_{n+1}, \quad \Rightarrow \quad \frac{1}{\mathfrak{F}} = \omega_i^2$$

If we agree that, near convergence,  $x_{n+1} \approx x_n$ , substituting in the previous equation we have

$$x_{n+1} \approx x_n = \omega_i^2 \, \hat{x}_{n+1} \quad \Rightarrow \quad \omega_i^2 \approx \frac{x_n}{\hat{x}_{n+1}}.$$

Of course the division of two vectors is not an option, so we want to twist it into something useful.

Of course the division of two vectors is not an option, so we want to twist it into something useful.

Analysis

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

First, consider  $x_n = \psi_i$ : in this case, for j = 1, ..., N it is

$$x_{n,j}/\hat{x}_{n+1,j}=\omega_i^2.$$

Analogously for  $x_n \neq \psi_i$  it was demonstrated that

$$\min_{j=1,\dots,N} \left\{ \frac{x_{n,j}}{\hat{x}_{n+1,j}} \right\} \leqslant \omega_i^2 \leqslant \max_{j=1,\dots,N} \left\{ \frac{x_{n,j}}{\hat{x}_{n+1,j}} \right\}.$$

A more rational approach would make reference to a proper vector norm, so using our preferred vector norm we can write

$$\omega_i^2 \approx \frac{\hat{x}_{n+1}^T M x_n}{\hat{x}_{n+1}^T M \hat{x}_{n+1}},$$

(if memory helps, this is equivalent to the  $R_{11}$  approximation, that we introduced studying Rayleigh quotient refinements).

Until now we postulated that the sequence  $x_n$  converges to some, unspecified eigenvector  $\psi_i$ , now we will demonstrate that the sequence converge to the first, or fundamental mode shape,

$$\lim_{n\to\infty}x_n=\psi_1.$$

Expand  $x_0$  in terms of eigenvectors an modal coordinates:

$$\mathbf{x}_0 = \psi_1 q_{1,0} + \psi_2 q_{2,0} + \psi_3 q_{3,0} + \cdots$$
 ,

and the inertial forces, assuming that the system is vibrating according to the fundamental frequency, are

$$\begin{split} f_{\mathrm{I},n=0} &= \omega_1^2 M \left( \psi_1 q_{1,0} + \psi_2 q_{2,0} + \psi_3 q_{3,0} + \cdots \right) \\ &= M \left( \omega_1^2 \psi_1 q_{1,0} \frac{\omega_1^2}{\omega_1^2} + \omega_2^2 \psi_2 q_{2,0} \frac{\omega_1^2}{\omega_2^2} + \cdots \right). \end{split}$$

Subspace Iteration

The deflections due to these forces (no hat!, we have multiplied by  $\omega_1^2$ ) are

$$\boldsymbol{x}_{n=1} = \boldsymbol{K}^{-1} \boldsymbol{M} \left( \omega_1^2 \psi_1 q_{1,0} \frac{\omega_1^2}{\omega_1^2} + \omega_2^2 \psi_2 q_{2,0} \frac{\omega_1^2}{\omega_2^2} + \cdots \right),$$

observing that  $\omega_i^2 M \psi_i = K \psi_i$ , substituting and simplifying  $K^{-1} K = I$ ,

$$\kappa_{n=1} = \left( \psi_1 q_{1,0} \frac{\omega_1^2}{\omega_1^2} + \psi_2 q_{2,0} \frac{\omega_1^2}{\omega_2^2} + \psi_3 q_{3,0} \frac{\omega_1^2}{\omega_3^2} + \cdots \right)$$

applying again this procedure

$$\mathbf{x}_{n=2} = \left( \psi_1 q_{1,0} \left( \frac{\omega_1^2}{\omega_1^2} \right)^2 + \psi_2 q_{2,0} \left( \frac{\omega_1^2}{\omega_2^2} \right)^2 + \psi_3 q_{3,0} \left( \frac{\omega_1^2}{\omega_3^2} \right)^2 + \cdots \right)$$

$$x_n = \left(\psi_1 q_{1,0} \left(\frac{\omega_1^2}{\omega_1^2}\right)^n + \psi_2 q_{2,0} \left(\frac{\omega_1^2}{\omega_2^2}\right)^n + \psi_3 q_{3,0} \left(\frac{\omega_1^2}{\omega_3^2}\right)^n + \cdots\right)$$

# Proof of Convergence, 3

Matrix Iteration

Giacomo Boffi

Introduction

Fundamental Mode Analysis

$$\underset{n\to\infty}{\lim}x_n=\psi_1q_{1,0}$$

because

$$\lim_{n\to\infty} \left(\frac{\omega_1^2}{\omega_j^2}\right)^n = \delta_{1j}$$

Consequently,

Going to the limit,

$$\lim_{n\to\infty}\frac{|\mathbf{x}_n|}{|\hat{\mathbf{x}}_n|}=\omega_1^2$$

If we know  $\psi_1$  and  $\omega_1^2$  from the matrix iteration procedure it is possible to compute the second eigenpair, following a slightly different procedure.

Express the initial iterate in terms of the (unknown) eigenvectors,

$$x_{n=0} = \Psi \, q_{n=0}$$

and premultiply by the (known)  $\psi_1^T M$ :

$$\psi_1^T M \, x_{n=0} = M_1 q_{1,n=0}$$

solving for  $q_{1,n=0}$ 

$$q_{1,n=0} = \frac{\psi_1^T M \chi_{n=0}}{M_1}.$$

Knowing the amplitude of the 1st modal contribution to  $x_{n=0}$  we can write a *purified* vector,

$$y_{n=0} = x_{n=0} - \psi_1 q_{1,n=0}$$

and premultiply by the (known)  $\psi_1^\mathsf{T} M$  :

$$\psi_1^T M x_{n=0} = M_1 q_{1,n=0}$$

solving for  $q_{1,n=0}$ 

$$q_{1,n=0} = \frac{\psi_1^T M \, x_{n=0}}{M_1}.$$

Knowing the amplitude of the 1st modal contribution to  $x_{n=0}$  we can write a *purified* vector,

$$y_{n=0} = x_{n=0} - \psi_1 q_{1,n=0}.$$

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

It is easy to demonstrate that using  $y_{\,n=0}$  as our starting vector

$$\lim_{n\to\infty}y_n=\psi_2q_{2,n=0},\qquad \lim_{n\to\infty}\frac{|y_n|}{|\hat{u}_n|}=\omega_2^2.$$

because the initial amplitude of the first mode is null.

Due to numerical errors in the determination of fundamental mode and in the procedure itself, using a plain matrix iteration the procedure however converges to the 1st eigenvector, so to preserve convergence to the 2nd mode it is necessary that the iterated vector  $\mathbf{y}_n$  is purified at each step n.

with  $q_{n,1}$  as before and

$$q_{2,n} = \boldsymbol{\psi}_2^\mathsf{T} \mathbf{M} \boldsymbol{y}_n / \mathbf{M}_2$$

substituting in the expression for the purified vector

$$\hat{y}_{n+1} = D\left(\underbrace{I - \frac{1}{M_1} \psi_1 \psi_1^\mathsf{T} M}_{S_1} - \frac{1}{M_2} \psi_2 \psi_2^\mathsf{T} M\right)$$

The conclusion is that the sweeping matrix and the modified dynamic matrix to be used to compute the 3rd eigenvector are

$$\mathbf{S}_2 = \mathbf{S}_1 - \frac{1}{M_2} \mathbf{\psi}_2 \mathbf{\psi}_2^\mathsf{T} \mathbf{M}, \qquad \mathbf{D}_3 = \mathbf{D} \, \mathbf{S}_2.$$

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

The results obtained for the third mode are easily generalised. It is easy to verify that the following procedure can be used to compute all the modes.

Define  $S_0 = I$ , take i = 1,

1. compute the modified dynamic matrix to be used for mode i,

$$D_{\mathfrak{i}} = D \: S_{\mathfrak{i}-\mathfrak{i}}$$

- 2. compute  $\psi_i$  using the modified dynamic matrix;
- 3. compute the modal mass  $M_i = \psi^T M \psi$ ;
- 4. compute the sweeping matrix  $S_i$  that sweeps the contributions of the first i modes from trial vectors,

$$S_{i} = S_{i-1} - \frac{1}{M_{i}} \psi_{i} \psi_{i}^{\mathsf{T}} M;$$

5. increment i, GOTO 1.

Well, we finally have a method that can be used to compute all the eigenpairs of our dynamic problems, full circle!

The results obtained for the third mode are easily generalised. It is easy to verify that the following procedure can be used to compute all the modes.

Define  $S_0 = I$ , take i = 1,

1. compute the modified dynamic matrix to be used for mode  $\ensuremath{\textbf{i}},$ 

$$D_i = D S_{i-i}$$

- 2. compute  $\psi_i$  using the modified dynamic matrix;
- 3. compute the modal mass  $M_i = \psi^T M \psi$ ;
- 4. compute the sweeping matrix  $S_i$  that sweeps the contributions of the first i modes from trial vectors,

$$S_i = S_{i-1} - \frac{1}{M_i} \psi_i \psi_i^\mathsf{T} M;$$

5. increment i, GOTO 1.

Well, we finally have a method that can be used to compute all the eigenpairs of our dynamic problems, full circle!

Introduction

Fundamental Mode Analysis

Second Mode Analysis

Higher Modes

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

The method of matrix iteration with sweeping is not used in production because

- D is a full matrix, even if M and K are banded matrices, and the matrix product that is the essential step in every iteration is computationally onerous,
- 2. the procedure is however affected by numerical errors, so, after having demonstrated that it is possible to compute all the eigenvectors of a large problem using an iterative procedure it is time to look for different, more efficient iterative procedures.

Inverse iteration is based on the fact that the symmetric stiffness matrix has a banded structure, that is a relatively large triangular portion of the matrix is composed by zeroes (the banded structure is due to the *FEM* model that implies that in an equation of equilibrium the only non zero elastic force coefficients are due to degrees of freedom pertaining to *FE* that contains the degree of freedom for which the equilibrium is written).

Subspace Iteration

Every symmetric, banded matrix can be subjected to a so called LU decomposition, that is, for K we write

$$K = LU$$

where  $\boldsymbol{L}$  and  $\boldsymbol{U}$  are, respectively, a lower- and an upper-banded matrix.

If we denote with b the bandwidth of K, we have

$$L = \begin{bmatrix} l_{ij} \end{bmatrix} \quad \text{with } l_{ij} \equiv 0 \text{ for } \begin{cases} i < j \\ j < i-b \end{cases}$$

and

$$\label{eq:uij} \boldsymbol{U} = \begin{bmatrix} u_{ij} \end{bmatrix} \quad \text{with } u_{ij} \equiv 0 \text{ for } \begin{cases} i > j \\ j > i + b \end{cases}$$

Rayleigh Methods

Subspace Iteration

In this case, with  $w_{
m n}=M\,x_{
m n}$ , the recursion can be written

 $L U x_{n+1} = w_n$ 

or as a system of equations,

$$\mathbf{U} x_{n+1} = z_{n+1}$$
$$\mathbf{L} z_{n+1} = w_n$$

Apparently, we have doubled the number of unknowns, but the  $z_j$ 's can be easily computed by the procedure of back substitution.

Second Mode Analysis

Higher Modes

Matrix Iteration

Rayleigh Methods

Subspace Iteration

Temporarily dropping the  $\mathfrak n$  and  $\mathfrak n+1$  subscripts, we can write

$$z_1 = (w_1)/l_{11}$$
  
 $z_2 = (w_2 - l_{21}z_1)/l_{22}$   
 $z_3 = (w_3 - l_{31}z_1 - l_{32}z_2)/l_{33}$ 

$$z_{j} = (w_{j} - \sum_{k=1}^{j-1} l_{jk} z_{k}) / l_{jj}$$

The x are then given by  $\mathbf{U}x=z$ .

write

Subspace Iteration

Temporarily dropping the n and n+1 subscripts, we can

$$z_1 = (w_1)/l_{11}$$
  
 $z_2 = (w_2 - l_{21}z_1)/l_{22}$ 

$$z_{3} = (w_{3} - l_{31}z_{1} - l_{32}z_{2})/l_{33}$$

$$3 = (w_3 - \iota_{31}z_1 - \iota_{32}z_2)/\iota_3$$

$$z_{j} = (w_{j} - \sum_{k=1}^{j-1} l_{jk} z_{k}) / l_{jj}$$

The x are then given by  $\mathbf{u} x = z$ .

Second Mode Analysis Higher Modes

Inverse Iteration

Matrix Iteration

Rayleigh Methods

Subspace Iteration

We have computed z by back substitution, we must solve  $\mathbf{U} x = z$  but  $\mathbf{U}$  is upper triangular, so we have

$$x_{N} = (z_{N})/u_{NN}$$

$$x_{N-1} = (z_{N-1} - u_{N-1,N} z_N) / u_{N-1,N-1}$$

$$x_{N-2} = (z_{N-2} - u_{N-2,N} z_N - u_{N-2,N-1} z_{N-1}) / u_{N-2,N-2}$$

. .

$$x_{N-j} = (z_{N-j} - \sum_{k=0}^{j-1} u_{N-j,N-k} z_{N-k}) / u_{N-j,N-j},$$

For moderately large systems, the reduction in operations count given by back substitution with respect to matrix multiplication is so large that the additional cost of the *LU* decomposition is negligible.

Second Mode Analysis

> Ravleigh Methods

Subspace Iteration

We have computed z by back substitution, we must solve  $\mathbf{U}x = z$  but U is upper triangular, so we have

$$x_{N} = (z_{N})/u_{NN}$$

$$x_{N-1} = (z_{N-1} - u_{N})$$

$$x_{N-1} = (z_{N-1} - u_{N-1,N}z_N)/u_{N-1,N-1}$$
  
$$x_{N-2} = (z_{N-2} - u_{N-2,N}z_N - u_{N-2,N-1}z_{N-1})/u_{N-2,N-2}$$

$$= (2N-2) \quad \alpha_{N-2,N} = \alpha_{N-2,N-1} = (2N-1)/(\alpha_{N-2,N})$$

$$x_{N-j} = (z_{N-j} - \sum_{k=0}^{j-1} u_{N-j,N-k} z_{N-k}) / u_{N-j,N-j},$$

For moderately large systems, the reduction in operations count given by back substitution with respect to matrix multiplication is so large that the additional cost of the LU decomposition is negligible.

#### Introduction to Shifts

Matrix Iteration

Giacomo Boffi

Introduction

Fundamental Mode Analysis

Second Mode Analysis

Higher Modes

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods

Subspace Iteration

Inverse iteration can be applied to each step of matrix iteration with sweeps, or to each step of a different procedure intended to compute all the eigenpairs, the *matrix iteration* with shifts.

If we write

$$\omega_i^2 = \mu + \lambda_i$$

where  $\mu$  is a shift and  $\lambda_i$  is a shifted eigenvalue, the eigenvalue problem can be formulated as

$$\mathbf{K}\,\boldsymbol{\psi}_{i} = (\boldsymbol{\mu} + \boldsymbol{\lambda}_{i})\mathbf{M}\,\boldsymbol{\psi}_{i}$$

or

$$(\mathbf{K} - \mu \mathbf{M})\psi_{i} = \lambda_{i} \mathbf{M} \psi_{i}.$$

If we introduce a modified stiffness matrix

$$\overline{\mathbf{K}} = \mathbf{K} - \mu \mathbf{M},$$

we recognize that we have a *new* problem, that has *exactly* the same eigenvectors and *shifted* eigenvalues,

$$\overline{\mathbf{K}}\,\mathbf{\Phi}_{\mathrm{i}} = \lambda_{\mathrm{i}}\mathbf{M}\mathbf{\Phi}_{\mathrm{i}},$$

where

$$\Phi_i = \Psi_i$$
,  $\lambda_i = \omega_i^2 - \mu$ .

Subspace Iteration

The shifted eigenproblem can be solved, e.g., by matrix iteration and the procedure will converge to the *smallest absolute value* shifted eigenvalue and to the associated eigenvector. After convergence is reached,

$$\psi_{\mathfrak{i}}=\varphi_{\mathfrak{i}},\qquad \omega_{\mathfrak{i}}^{2}=\lambda_{\mathfrak{i}}+\mu.$$

The convergence of the method can be greatly enhanced if the shift  $\mu$  is updated every few steps during the iterative procedure using the current best estimate of  $\lambda_i$ ,

$$\lambda_{i,n+1} = \frac{\hat{x}_{n+1} M x_n}{\hat{x}_{n+1} M \hat{x}_n},$$

to improve the modified stiffness matric to be used in the following iterations,

$$\overline{K} = \overline{K} - \lambda_{i,n+1} M$$

Much thought was spent on the problem of choosing the initial shifts, so that all the eigenvectors can be computed in sequence without missing any of them.

where  $\phi$  is an assumed shape vector, not an eigenvector.

Second Mode Analysis Higher Modes

Inverse Iteration

Matrix Iteration

Rayleigh Methods

Rayleigh-Ritz Method

Subspace Iteration

For a N DOF system, an approximation to a displacement vector  $\mathbf{x}$  can be written in terms of a set of M < N assumed shape, linearly independent vectors,

$$\Phi_i$$
,  $i = 1, \ldots, M < N$ 

and a set of *Ritz coordinates*  $z_i$ ,  $i-1, \ldots, M < N$ :

$$x = \sum_{i} \Phi_{i} z_{i} = \Phi z.$$

We say approximation because a linear combination of M < N vectors cannot describe every point in a N-space.

Second Mode Analysis Higher Modes

Inverse Iteration

Matrix Iteration with Shifts

Rayleigh Methods Rayleigh-Ritz

Method

Subspace Iteration

We can write the Rayleigh quotient as a function of the Ritz coordinates.

$$\omega^2(z) = \frac{z^\mathsf{T} \Phi^\mathsf{T} K \Phi z}{z^\mathsf{T} \Phi^\mathsf{T} M \Phi z} = \frac{\overline{k}(z)}{\overline{\mathfrak{m}}(z)},$$

but this is not an explicit fuction for any modal frequency... On the other hand, we have seen that frequency estimates are always greater than true frequencies, so our best estimates are the the local minima of  $\omega^2(z)$ , or the points where all the derivatives of  $\omega^2(z)$  with respect to  $z_i$  are zero

$$\frac{\partial \omega^2(z)}{\partial z_i} = \frac{\overline{m}(z) \frac{\partial \overline{k}(z)}{\partial z_i} - \overline{k}(z) \frac{\partial \overline{m}(z)}{\partial z_i}}{(\overline{m}(z))^2} = 0, \qquad \text{for } i = 1, \dots, M < N$$

Inverse Iteration

Matrix Iteration with Shifts

Ravleigh Methods Rayleigh-Ritz

Method Subspace

Iteration

We can write the Rayleigh quotient as a function of the Ritz coordinates.

$$\omega^{2}(z) = \frac{z^{\mathsf{T}} \Phi^{\mathsf{T}} K \Phi z}{z^{\mathsf{T}} \Phi^{\mathsf{T}} M \Phi z} = \frac{\overline{k}(z)}{\overline{m}(z)},$$

but this is not an explicit fuction for any modal frequency... On the other hand, we have seen that frequency estimates are always greater than true frequencies, so our best estimates are the the local minima of  $\omega^2(z)$ , or the points where all the derivatives of  $\omega^2(z)$  with respect to  $z_i$  are zero:

$$\frac{\partial \omega^2(z)}{\partial z_i} = \frac{\overline{\mathfrak{m}}(z) \frac{\partial \overline{k}(z)}{\partial z_i} - \overline{k}(z) \frac{\partial \overline{\mathfrak{m}}(z)}{\partial z_i}}{(\overline{\mathfrak{m}}(z))^2} = 0, \qquad \text{for } i = 1, \dots, M < N$$

## Reduced Eigenproblem

Observing that

$$\overline{k}(z) = \omega^2(z)\overline{\mathfrak{m}}(z)$$

we can substitute into and simplify the preceding equation,

$$\frac{\partial \overline{k}(z)}{\partial z_i} - \omega^2(z) \frac{\partial \overline{m}(z)}{\partial z_i} = 0, \qquad \text{for } i = 1, \dots, M < N$$

With the positions

$$\overline{\mathbf{K}} = \mathbf{\Phi}^{\mathsf{T}} \mathbf{K} \, \mathbf{\Phi}, \qquad \overline{\mathbf{M}} = \mathbf{\Phi}^{\mathsf{T}} \mathbf{M} \, \mathbf{\Phi}$$

we hav

$$\overline{\mathbf{k}}(z) = z^{\mathsf{T}} \overline{\mathbf{K}} z = \sum_{\mathbf{i}} \sum_{\mathbf{j}} \overline{\mathbf{k}}_{\mathbf{i} \mathbf{j}} z_{\mathbf{j}} z_{\mathbf{i}}$$

and

$$rac{\partial \overline{k}(z)}{\partial z_i} = 2\sum_j \overline{k}_{ij}z_j = 2\overline{K}z$$
, and, analogously,  $rac{\partial \overline{m}(z)}{\partial z_i} = 2\overline{M}z$ 

Substituting these results in  $\frac{\partial k(z)}{\partial z_i} - \omega^2(z) \frac{\partial \overline{m}(z)}{\partial z_i} = 0$  we can write a new eigenvector problem, in the M DOF Ritz coordinates space, with reduced  $M \times M$  matrices:

$$\overline{K}z - \omega^2 \overline{M}z = 0.$$

After solving the reduced eigenproblem, we have a set of M eigenvalues  $\overline{\omega}_i^2$  and a corresponding set of M eigenvectors  $\overline{z}_i$ . What is the relation between these results and the eigenpairs of the original problem?

The  $\overline{\omega}_i^2$  clearly are approximations from above to the real eigenvalues, and if we write  $\overline{\psi}_i = \Phi \overline{z}_i$  we see that, being

$$\overline{\psi}_i^T M \overline{\psi}_j = \overline{z}_i^T \underbrace{\Phi^T M \Phi}_{\overline{M}} \overline{z}_j = \overline{M}_i \delta_{ij},$$

the approximated eigenvectors  $\overline{\psi}_i$  are orthogonal with respect to the structural matrices and can be used in ordinary modal superposition techniques.
