## Introductory Remarks

Today we will study the properties of structural matrices, that is the operators that relate the vector of system coordinates $\mathbf{x}$ and its time derivatives $\dot{\mathbf{x}}$ and $\ddot{\mathbf{x}}$ to the forces acting on the system nodes, $\mathbf{f}_{S}, \mathbf{f}_{\mathrm{D}}$ and $\mathbf{f}_{\mathrm{l}}$, respectively.

Additional Orthogonality Relationships

## Evaluation of Structural Matrices

## Structural Matrices

We already met the mass and the stiffness matrix, $\mathbf{M}$ and $\mathbf{K}$, and tangentially we introduced also the dampig matrix $\mathbf{C}$.

Giacomo Boffi
We have seen that these matrices express the linear relation that holds between the vector of system coordinates $\mathbf{x}$ and its time derivatives $\dot{\mathbf{x}}$ and $\ddot{\mathbf{x}}$ to the forces acting on the system nodes, $\mathbf{f}_{\mathrm{S}}, \mathbf{f}_{\mathrm{D}}$ and $\mathbf{f}_{1}$, elastic, damping and inertial force vectors.

$$
\begin{aligned}
\mathbf{M} \ddot{\mathbf{x}}+\mathbf{C} \dot{\mathbf{x}}+\mathbf{K} \mathbf{x} & =\mathbf{p}(t) \\
\mathbf{f}_{\mathrm{l}}+\mathbf{f}_{\mathrm{D}}+\mathbf{f}_{\mathrm{S}} & =\mathbf{p}(t)
\end{aligned}
$$

Also, we know that $\mathbf{M}$ and $\mathbf{K}$ are symmetric and definite positive, and that it is possible to uncouple the equation of motion expressing the system coordinates in terms of the eigenvectors, $\mathbf{x}(t)=\sum q_{i} \boldsymbol{\psi}_{i}$, where the $q_{i}$ are the modal coordinates and the eigenvectors $\psi_{i}$ are the non-trivial solutions to the equation of free vibrations,

$$
\left(\mathbf{K}-\omega^{2} \mathbf{M}\right) \boldsymbol{\psi}=\mathbf{0}
$$

## Free Vibrations

From the homogeneous, undamped problem
we wrote the homogeneous linear system

$$
\left(\mathbf{K}-\omega^{2} \mathbf{M}\right) \boldsymbol{\psi}=\mathbf{0}
$$

whose non-trivial solutions $\psi_{i}$ for $\omega_{i}^{2}$ such that $\left\|\mathbf{K}-\omega_{i}^{2} \mathbf{M}\right\|=0$ are the eigenvectors. It was demonstrated that, for each pair of distint eigenvalues $\omega_{r}^{2}$ and $\omega_{s}^{2}$, the corresponding eigenvectors obey the ortogonality condition,

$$
\boldsymbol{\psi}_{s}^{T} \mathbf{M} \boldsymbol{\psi}_{r}=\delta_{r s} M_{r}, \quad \boldsymbol{\psi}_{s}^{T} \mathbf{K} \boldsymbol{\psi}_{r}=\delta_{r s} \omega_{r}^{2} M_{r} .
$$

## Additional Orthogonality Relationships

Starting from the equation of free vibrations (EOFV)

$$
\mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \mathbf{M} \boldsymbol{\psi}_{s}
$$

pre-multiplying both members by $\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1}$ we have

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s}
$$

## Additional Orthogonality Relationships

Starting from the equation of free vibrations (EOFV)

$$
\mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \mathbf{M} \boldsymbol{\psi}_{s}
$$

pre-multiplying both members by $\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1}$ we have

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{4} \boldsymbol{\psi}_{r}^{T} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{r}^{4} M_{r} .
$$

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T} \mathbf{K M}^{-1} \mathbf{K M}^{-1}$ we have (compare with our previous result)

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=
$$

## Additional Orthogonality Relationships

Starting from the equation of free vibrations (EOFV)

$$
\mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \mathbf{M} \boldsymbol{\psi}_{s}
$$

pre-multiplying both members by $\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1}$ we have

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{4} \boldsymbol{\psi}_{r}^{T} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{r}^{4} M_{r} .
$$

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T} \mathbf{K M}^{-1} \mathbf{K M}^{-1}$ we have (compare with our previous result)

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{r}^{6} M_{r}
$$

## Additional Orthogonality Relationships

Starting from the equation of free vibrations (EOFV)

$$
\mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \mathbf{M} \boldsymbol{\psi}_{s}
$$

pre-multiplying both members by $\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1}$ we have

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{4} \boldsymbol{\psi}_{r}^{T} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{r}^{4} M_{r} .
$$

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T} \mathbf{K M}^{-1} \mathbf{K M}^{-1}$ we have (compare with our previous result)

$$
\boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\omega_{s}^{2} \boldsymbol{\psi}_{r}^{T} \mathbf{K} \mathbf{M}^{-1} \mathbf{K} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{r}^{6} M_{r}
$$

and, generalizing,

$$
\boldsymbol{\psi}_{r}^{T}\left(\mathbf{K M}^{-1}\right)^{b} \mathbf{K} \boldsymbol{\psi}_{s}=\delta_{r s}\left(\omega_{r}^{2}\right)^{b+1} M_{r}
$$

## Additional Relationships, 2

Let's rearrange the equation of free vibrations

$$
\mathbf{M} \boldsymbol{\psi}_{s}=\omega_{s}^{-2} \mathbf{K} \boldsymbol{\psi}_{s} .
$$

Pre-multiplying both members by $\boldsymbol{\psi}_{r}^{T} \mathbf{M K}{ }^{-1}$ we have

## Additional Relationships, 2

Let's rearrange the equation of free vibrations

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{2}$ we have

$$
\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{2} \mathbf{M} \boldsymbol{\psi}_{s}=\omega_{s}^{-2} \boldsymbol{\psi}_{r}^{T} \mathbf{M} K^{-1} \mathbf{M} \boldsymbol{\psi}_{s}
$$

## Additional Relationships, 2

Let's rearrange the equation of free vibrations

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{2}$ we have

$$
\left.\boldsymbol{\psi}_{r}^{T}(\mathbf{M K})^{-1}\right)^{2} \mathbf{M} \boldsymbol{\psi}_{s}=\omega_{s}^{-2} \boldsymbol{\psi}_{r}^{T} \mathbf{M} \mathbf{K}^{-1} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \frac{M_{s}}{\omega_{s}^{4}}
$$

## Additional Relationships, 2

Let's rearrange the equation of free vibrations

Pre-multiplying both members of the EOFV by $\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{2}$ we have

$$
\left.\boldsymbol{\psi}_{r}^{T}(\mathbf{M K})^{-1}\right)^{2} \mathbf{M} \boldsymbol{\psi}_{s}=\omega_{s}^{-2} \boldsymbol{\psi}_{r}^{T} \mathbf{M} \mathbf{K}^{-1} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \frac{M_{s}}{\omega_{s}^{4}}
$$

and, generalizing,

$$
\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M} \mathbf{K}^{-1}\right)^{b} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s} \frac{M_{s}}{\omega_{s}^{2 b}}
$$

## Additional Relationships, 3

Defining $X^{(k)}=\mathbf{M}\left(\mathbf{M}^{-1} \mathbf{K}\right)^{k}$ we have

Structural

$$
\begin{cases}\boldsymbol{\psi}_{r}^{T} X^{(0)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T} \mathbf{M} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{0} M_{s} \\ \boldsymbol{\psi}_{r}^{T} X^{(1)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{1} M_{s} \\ \boldsymbol{\psi}_{r}^{T} X^{(2)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{K} \mathbf{M}^{-1}\right)^{1} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{2} M_{s} \\ \cdots & \\ \boldsymbol{\psi}_{r}^{T} X^{(n)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{K M}^{-1}\right)^{n-1} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{n} M_{s}\end{cases}

Defining $X^{(k)}=\mathbf{M}\left(\mathbf{M}^{-1} \mathbf{K}\right)^{k}$ we have

$$
\begin{cases}\boldsymbol{\psi}_{r}^{T} X^{(0)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T} \mathbf{M} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{0} M_{s} \\ \boldsymbol{\psi}_{r}^{T} X^{(1)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{1} M_{s} \\ \boldsymbol{\psi}_{r}^{T} X^{(2)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{K} \mathbf{M}^{-1}\right)^{1} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{2} M_{s} \\ \cdots & \\ \boldsymbol{\psi}_{r}^{T} X^{(n)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{K M}^{-1}\right)^{n-1} \mathbf{K} \boldsymbol{\psi}_{s} & =\delta_{r s}\left(\omega_{s}^{2}\right)^{n} M_{s}\end{cases}
$$

Giacomo Boffi

Observing that $\left(\mathbf{M}^{-1} \mathbf{K}\right)^{-1}=\left(\mathbf{K}^{-1} \mathbf{M}\right)^{1}$

$$
\left\{\begin{array}{l}
\boldsymbol{\psi}_{r}^{T} X^{(-1)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{1} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s}\left(\omega_{s}^{2}\right)^{-1} M_{s} \\
\ldots \\
\boldsymbol{\psi}_{r}^{T} X^{(-n)} \boldsymbol{\psi}_{s}=\boldsymbol{\psi}_{r}^{T}\left(\mathbf{M K}^{-1}\right)^{n} \mathbf{M} \boldsymbol{\psi}_{s}=\delta_{r s}\left(\omega_{s}^{2}\right)^{-n} M_{s}
\end{array}\right.
$$

We can conclude that we the eigenvectors are orthogonal with respect to an infinite number of matrices $\mathbf{X}^{(k)}$ ( $\mathbf{M}$ and $\mathbf{K}$ being two particular cases):

$$
\boldsymbol{\psi}_{r}^{T} X^{(k)} \boldsymbol{\psi}_{s}=\delta_{r s} \omega_{s}^{2 k} M_{s} \quad \text { for } k=-\infty, \ldots, \infty
$$

## Elastic Forces

Momentarily disregarding inertial effects, each node shall be in equilibrium under the action of the external forces and the elastic forces, hence taking into accounts all the nodes, all the external forces and all the elastic forces it is possible to write the vector equation of equilibrium

$$
\mathbf{p}=\mathbf{f}_{S}
$$

and, substituting in the previos vector expression of the displacements

$$
\mathbf{x}=\mathbf{F} \mathbf{f}_{S}

## Stiffness Matrix

The stiffness matrix $\mathbf{K}$ can be simply defined as the inverse of the flexibility matrix $\mathbf{F}$,

$$
\mathbf{K}=\mathbf{F}^{-1} .
$$

Introductory
Remarks

To understand our formal definition, we must consider an unary vector of displacements,

$$
\mathbf{e}^{(i)}=\left\{\delta_{i j}\right\}, \quad j=1, \ldots, N,
$$

and the vector of nodal forces $\mathbf{k}_{i}$ that, applied to the structure, produces the displacements $\mathbf{e}^{(i)}$

$$
\mathbf{F} \mathbf{k}_{i}=\mathbf{e}^{(i)}, \quad i=1, \ldots, N
$$

## Stiffness Matrix

Collecting all the ordered $\mathbf{e}^{(i)}$ in a matrix $\mathbf{E}$, it is clear that $\mathbf{E} \equiv \mathbf{I}$ and we have, writing all the equations at once,

$$
\mathbf{F}\left[\mathbf{k}_{i}\right]=\left[\mathbf{e}^{(i)}\right]=\mathbf{E}=\mathbf{I} .
$$

## Stiffness Matrix

Collecting all the ordered $\mathbf{e}^{(i)}$ in a matrix $\mathbf{E}$, it is clear that $\mathbf{E} \equiv \mathbf{I}$ and we have, writing all the equations at once,

$$
\mathbf{F}\left[\mathbf{k}_{i}\right]=\left[\mathbf{e}^{(i)}\right]=\mathbf{E}=\mathbf{I} .
$$

Giacomo Boffi

$$
\mathbf{F K}=\mathbf{I}, \quad \Rightarrow \quad \mathbf{K}=\mathbf{F}^{-1}
$$

giving a physical interpretation to the columns of the stiffness matrix.
Finally, writing the nodal equilibrium, we have

$$
\mathbf{p}=\mathbf{f}_{\mathrm{S}}=\mathbf{K} \mathbf{x}
$$

## Strain Energy

The elastic strain energy $V$ can be written in terms of displacements and external forces,

$$
V=\frac{1}{2} \mathbf{p}^{T} \mathbf{x}=\frac{1}{2}\left\{\begin{array}{l}
\mathbf{p}^{T} \underbrace{\mathbf{F} \mathbf{p}}_{\mathbf{x}}, \\
\underbrace{\mathbf{x}^{T} \mathbf{K}}_{\mathbf{p}^{T}} \mathbf{x} .
\end{array}\right.
$$

Because the elastic strain energy of a stable system is always greater than zero, $\mathbf{K}$ is a positive definite matrix.

Introductory
Remarks
Structural
Matrices

## Strain Energy

The elastic strain energy $V$ can be written in terms of displacements and external forces,

$$
V=\frac{1}{2} \mathbf{p}^{T} \mathbf{x}=\frac{1}{2}\left\{\begin{array}{l}
\mathbf{p}^{T} \underbrace{\mathbf{F} \mathbf{p}}_{\mathbf{x}}, \\
\underbrace{\mathbf{x}^{T} \mathbf{K}}_{\mathbf{p}^{T}} \mathbf{x} .
\end{array}\right.
$$

Because the elastic strain energy of a stable system is always greater than zero, $\mathbf{K}$ is a positive definite matrix.

On the other hand, for an unstable system, think of a compressed beam, there are displacement patterns that are associated to zero strain energy.

Introductory
Remarks
Structural
Matrices
Evaluation of
Structural
Matrices
Flexibility Matrix Example
Stiffness Matrix
Strain Energy
Symmetry
Direct Assemblage

## Symmetry

Two sets of loads $\mathbf{p}^{A}$ and $\mathbf{p}^{B}$ are applied, one after the other, to an elastic system; the work done is

$$
V_{A B}=\frac{1}{2} \mathbf{p}^{A^{T}} \mathbf{x}^{A}+\mathbf{p}^{A^{T}} \mathbf{x}^{B}+\frac{1}{2} \mathbf{p}^{B^{T}} \mathbf{x}^{B}
$$

$$
V_{B A}=\frac{1}{2} \mathbf{p}^{B^{T}} \mathbf{x}^{B}+\mathbf{p}^{B^{T}} \mathbf{x}^{A}+\frac{1}{2} \mathbf{p}^{A^{T}} \mathbf{x}^{A}
$$

The total work being independent of the order of loading,

$$
\mathbf{p}^{A^{T}} \mathbf{x}^{B}=\mathbf{p}^{B^{T}} \mathbf{x}^{A}
$$

## Symmetry, 2

Expressing the displacements in terms of $\mathbf{F}$,

$$
\mathbf{p}^{A^{T}} \mathbf{F} \mathbf{p}^{B}=\mathbf{p}^{B^{T}} \mathbf{F} \mathbf{p}^{A}
$$

both terms are scalars so we can write

$$
\mathbf{p}^{A^{T}} \mathbf{F} \mathbf{p}^{B}=\left(\mathbf{p}^{B^{T}} \mathbf{F} \mathbf{p}^{A}\right)^{T}=\mathbf{p}^{A^{T}} \mathbf{F}^{T} \mathbf{p}^{B}
$$

Because this equation holds for every $\mathbf{p}$, we conclude that

$$
\mathbf{F}=\mathbf{F}^{T} .
$$

The inverse of a symmetric matrix is symmetric, hence

$$
\mathbf{K}=\mathbf{K}^{T}
$$

Giacomo Boffi

## A practical consideration

For the kind of structures we mostly deal with in our examples, problems, exercises and assignments, that is simple structures, it is usually convenient to compute first the flexibility matrix applying the Principle of Virtual Displacements and later the stiffness matrix, using inversion,

$$
\mathbf{K}=\mathbf{F}^{-1} .
$$

Consider a 2-D inextensible beam element, that has 4 DOF, namely two transverse end displacements $x_{1}, x_{2}$ and two end rotations, $x_{3}, x_{4}$.

Giacomo Boffi

The element stiffness is computed using 4 shape functions $\phi_{i}$, the transverse displacement being $v(s)=\sum_{i} \phi_{i}(s) x_{i}, 0 \leq s \leq L$, the different $\phi_{i}$ are such all end displacements or rotation are zero, except the one corresponding to index $i$.
The shape functions for a beam are

$$
\begin{array}{ll}
\phi_{1}(s)=1-3\left(\frac{s}{L}\right)^{2}+2\left(\frac{s}{L}\right)^{3}, & \phi_{2}(s)=3\left(\frac{s}{L}\right)^{2}-2\left(\frac{s}{L}\right)^{3} \\
\phi_{3}(s)=\left(\frac{s}{L}\right)-2\left(\frac{s}{L}\right)^{2}+\left(\frac{s}{L}\right)^{3}, & \phi_{4}(s)=-\left(\frac{s}{L}\right)^{2}+\left(\frac{s}{L}\right)^{3}
\end{array}
$$

## Example, 2

The element stiffness coefficients can be computed using, what else, the PVD: we compute the external virtual work done by a virtual displacement $\delta x_{i}$ and the force due to a unit displacement $x_{j}$, that is $k_{i j}$,

## Mass Matrix

The mass matrix maps the nodal accelerations to nodal inertial forces, and the most common assumption is to concentrate all the masses in nodal point masses, without rotational inertia, computed lumping a fraction of each element mass (or a fraction of the supported mass) on all its bounding nodes.
This procedure leads to a so called lumped mass matrix, a diagonal matrix with diagonal elements greater than zero for all the translational degrees of freedom and diagonal elements equal to zero for angular degrees of freedom.

## Mass Matrix

The mass matrix is definite positive only if all the structure DOF's are translational degrees of freedom, otherwise $\mathbf{M}$ is semi-definite positive and the eigenvalue procedure is not directly applicable. This problem can be overcome either by using a consistent mass matrix or using the static condensation procedure.

## Consistent Mass Matrix

A consistent mass matrix is built using the rigorous FEM procedure, computing the nodal reactions that equilibrate the distributed inertial forces that develop in the element due to a linear combination of inertial forces.
Using our beam example as a reference, consider the inertial forces associated with a single nodal acceleration $\ddot{x}_{j}, f_{1, j}(s)=m(s) \phi_{j}(s) \ddot{x}_{j}$ and denote with $m_{i j} \ddot{x}_{j}$ the reaction associated with the $i$-nth degree of freedom of the element, by the PVD

$$
\delta x_{i} m_{i j} \ddot{x}_{j}=\int \delta x_{i} \phi_{i}(s) m(s) \phi_{j}(s) \mathrm{d} s \ddot{x}_{j}
$$

simplifying

$$
m_{i j}=\int m(s) \phi_{i}(s) \phi_{j}(s) \mathrm{d} s
$$

For $m(s)=\bar{m}=$ const.

$$
\mathbf{f}_{1}=\frac{\bar{m} L}{420}\left[\begin{array}{cccc}
156 & 54 & 22 L & -13 L \\
54 & 156 & 13 L & -22 L \\
22 L & 13 L & 4 L^{2} & -3 L^{2} \\
-13 L & -22 L & -3 L^{2} & 4 L^{2}
\end{array}\right] \ddot{\mathbf{x}}
$$

## Damping Matrix

## Damping Matrix

For each element $c_{i j}=\int c(s) \phi_{i}(s) \phi_{j}(s) \mathrm{d} s$ and the damping matrix $\mathbf{C}$ can be assembled from element contributions.
However, using the FEM $\mathbf{C}^{\star}=\boldsymbol{\Psi}^{T} \mathbf{C} \boldsymbol{\Psi}$ is not diagonal and the modal equations are no more uncoupled!

## Damping Matrix

For each element $c_{i j}=\int c(s) \phi_{i}(s) \phi_{j}(s) \mathrm{d} s$ and the damping matrix $\mathbf{C}$ can be assembled from element contributions.
However, using the FEM $\mathbf{C}^{\star}=\boldsymbol{\Psi}^{T} \mathbf{C} \boldsymbol{\Psi}$ is not diagonal and the modal equations are no more uncoupled!
The alternative is to write directly the global damping matrix, in terms of the underdetermined coefficients $\mathfrak{c}_{b}$,

$$
\mathbf{C}=\sum_{b} \mathfrak{c}_{b} \mathbf{M}\left(\mathbf{M}^{-1} \mathbf{K}\right)^{b}
$$

## Damping Matrix

With our definition of $\mathbf{C}$,

$$
\mathbf{C}=\sum_{b} \mathfrak{c}_{b} \mathbf{M}\left(\mathbf{M}^{-1} \mathbf{K}\right)^{b}
$$

## Damping Matrix

With our definition of $\mathbf{C}$,

$$
\mathbf{C}=\sum_{b} \mathfrak{c}_{b} \mathbf{M}\left(\mathbf{M}^{-1} \mathbf{K}\right)^{b}
$$

$$
C_{j}=\boldsymbol{\psi}_{j}^{T} \mathbf{C} \boldsymbol{\psi}_{j}=\sum_{b} \mathfrak{c}_{b} \omega_{j}^{2 b}=2 \zeta_{j} \omega_{j}
$$

and we can write a system of linear equations in the $\mathfrak{c}_{b}$.

## Example

We want a fixed, $5 \%$ damping ratio for the first three modes, taking note that the modal equation of motion is

Giacomo Boffi

$$
\mathbf{C}=\mathfrak{c}_{0} \mathbf{M}+\mathfrak{c}_{1} \mathbf{K}+\mathfrak{c}_{2} \mathbf{K} \mathbf{M}^{-1} \mathbf{K}
$$

we have

$$
2 \times 0.05\left\{\begin{array}{l}
\omega_{1} \\
\omega_{2} \\
\omega_{3}
\end{array}\right\}=\left[\begin{array}{ccc}
1 & \omega_{1}^{2} & \omega_{1}^{4} \\
1 & \omega_{2}^{2} & \omega_{2}^{4} \\
1 & \omega_{3}^{2} & \omega_{3}^{4}
\end{array}\right]\left\{\begin{array}{l}
\mathfrak{c}_{0} \\
c_{1} \\
c_{2}
\end{array}\right\}
$$

Solving for the c's and substituting above, the resulting damping matrix is orthogonal to every eigenvector of the system, for the first three modes, leads to a modal damping ratio that is equal to $5 \%$.

## Example

Computing the coefficients $\mathfrak{c}_{0}, \mathfrak{c}_{1}$ and $\mathfrak{c}_{2}$ to have a $5 \%$ damping at frequencies $\omega_{1}=2, \omega_{2}=5$ and $\omega_{3}=8$ we have $c_{0}=1200 / 9100$, $\mathfrak{c}_{1}=159 / 9100$ and $\mathfrak{c}_{2}=-1 / 9100$.
Writing
$\zeta(\omega)=\frac{1}{2}\left(\frac{c_{0}}{\omega}+c_{1} \omega+c_{2} \omega^{3}\right)$ we can plot the above function, along with its two term equivalent $\left(c_{0}=10 / 70, c_{1}=1 / 70\right)$.

Evaluation of Structural Matrices
If we choose a simplified approach, we must use a procedure to remove unneeded structural DOF's from the model that we use for the dynamic analysis.
Enter the Static Condensation Method.

## Static Condensation

We have, from a $F E M$ analysis, a stiffnes matrix that uses all nodal $D O F$ 's, and from the lumped mass procedure a mass matrix were only translational (and maybe a few rotational) DOF's are blessed with a non zero diagonal term.

Static Condensation

## Static Condensation, 3

... the equation of dynamic equilibrium,

$$
\begin{aligned}
\mathbf{p}_{A} & =\mathbf{M}_{A A} \ddot{\mathbf{x}}_{A}+\mathbf{M}_{A B} \ddot{\mathbf{x}}_{B}+\mathbf{K}_{A A} \mathbf{x}_{A}+\mathbf{K}_{A B} \mathbf{x}_{B} \\
\mathbf{p}_{B} & =\mathbf{M}_{B A} \ddot{\mathbf{x}}_{A}+\mathbf{M}_{B B} \ddot{\mathbf{x}}_{B}+\mathbf{K}_{B A} \mathbf{x}_{A}+\mathbf{K}_{B B} \mathbf{x}_{B}
\end{aligned}
$$

solving for $\mathbf{x}_{B}$ in the 2 nd equation and substituting

$$
\begin{aligned}
\mathbf{x}_{B} & =\mathbf{K}_{B B}^{-1} \mathbf{p}_{B}-\mathbf{K}_{B B}^{-1} \mathbf{K}_{B A} \mathbf{x}_{A} \\
\mathbf{p}_{A}-\mathbf{K}_{A B} \mathbf{K}_{B B}^{-1} \mathbf{p}_{B} & =\mathbf{M}_{A A} \ddot{\mathbf{x}}_{A}+\left(\mathbf{K}_{A A}-\mathbf{K}_{A B} \mathbf{K}_{B B}^{-1} \mathbf{K}_{B A}\right) \mathbf{x}_{A}
\end{aligned}
$$

## Static Condensation, 4

Going back to the homogeneous problem, with obvious positions we can write

$$
\left(\overline{\mathbf{K}}-\omega^{2} \overline{\mathbf{M}}\right) \boldsymbol{\psi}_{A}=\mathbf{0}
$$

but the $\boldsymbol{\psi}_{A}$ are only part of the structural eigenvectors, because in essentially every application we must consider also the other DOF's, so we write

$$
\boldsymbol{\psi}_{i}=\left\{\begin{array}{l}
\boldsymbol{\psi}_{A, i} \\
\boldsymbol{\psi}_{B, i}
\end{array}\right\} \text {, with } \boldsymbol{\psi}_{B, i}=\mathbf{K}_{B B}^{-1} \mathbf{K}_{B A} \boldsymbol{\psi}_{A, i}
$$
